OCM Project Lightning Talk · Salt Lake City

Hub → managed cluster:
how long did the workload take? Did it arrive?

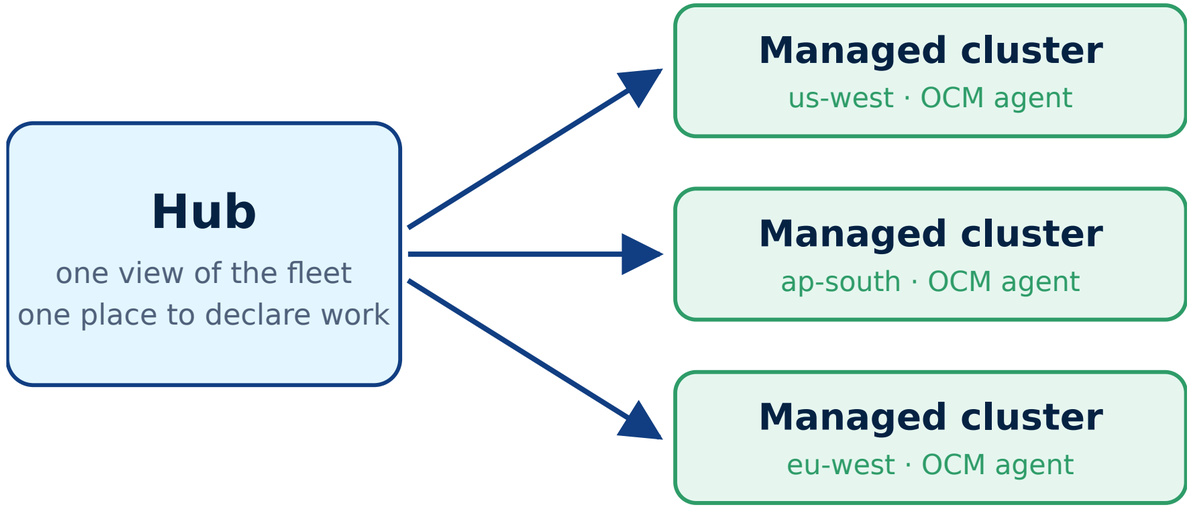

Suvaansh Kumar · Software Engineer at Guidewire · Open Cluster Management maintainer

THE PROJECT

Open Cluster Management

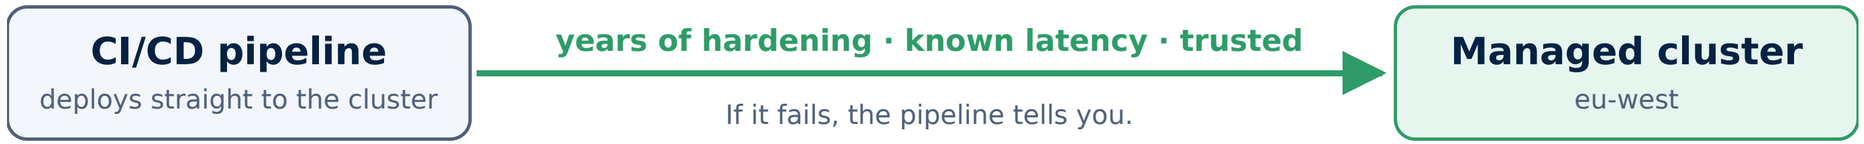

- **CNCF Sandbox project**, now in its **6th year**
- **Hub and spoke** architecture with a centralized view of your entire fleet

`open-cluster-management.io` `github.com/open-cluster-management-io`

WHY WE ARE PROPOSING THIS

TODAY

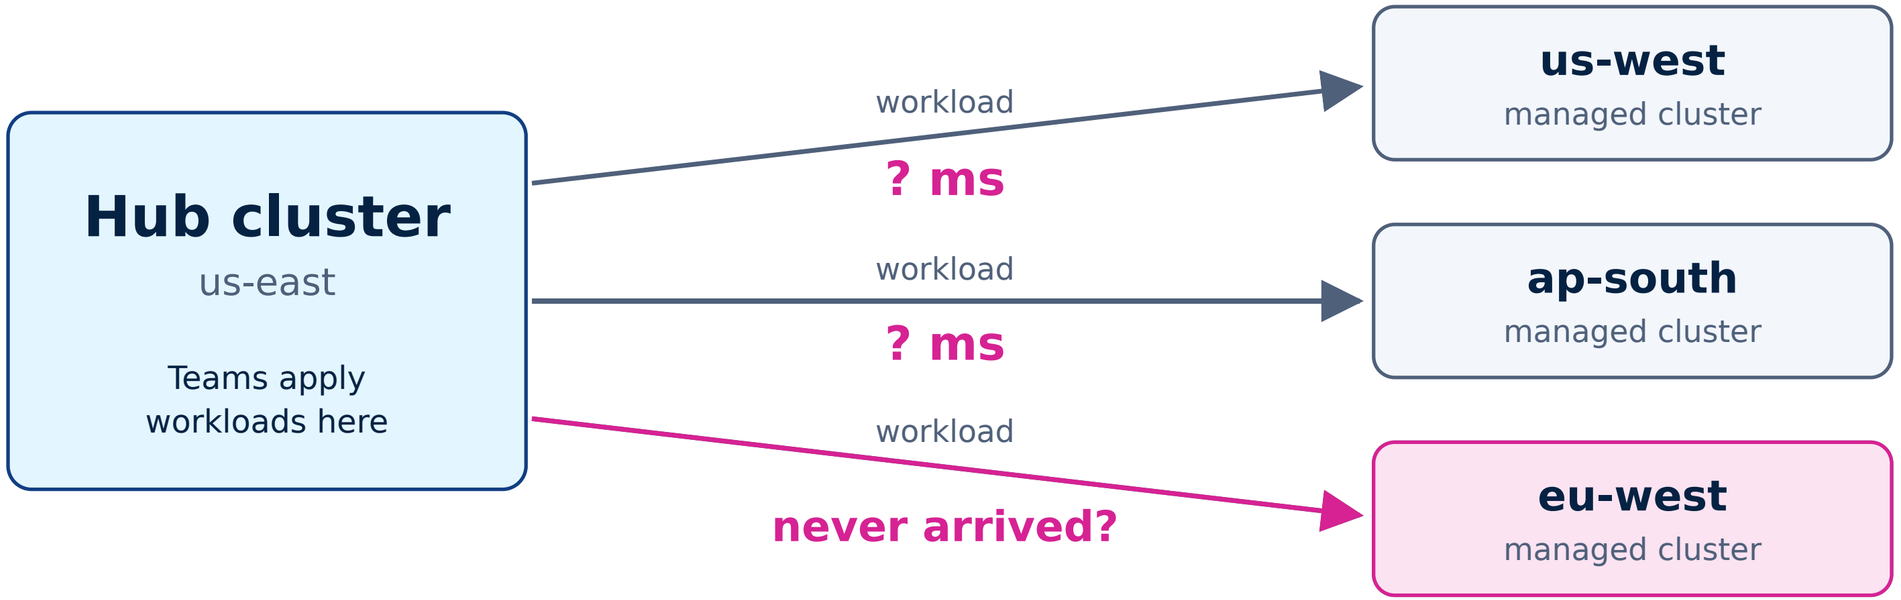

A new layer in a pipeline teams already trust

WITH OCM

THE USE CASE

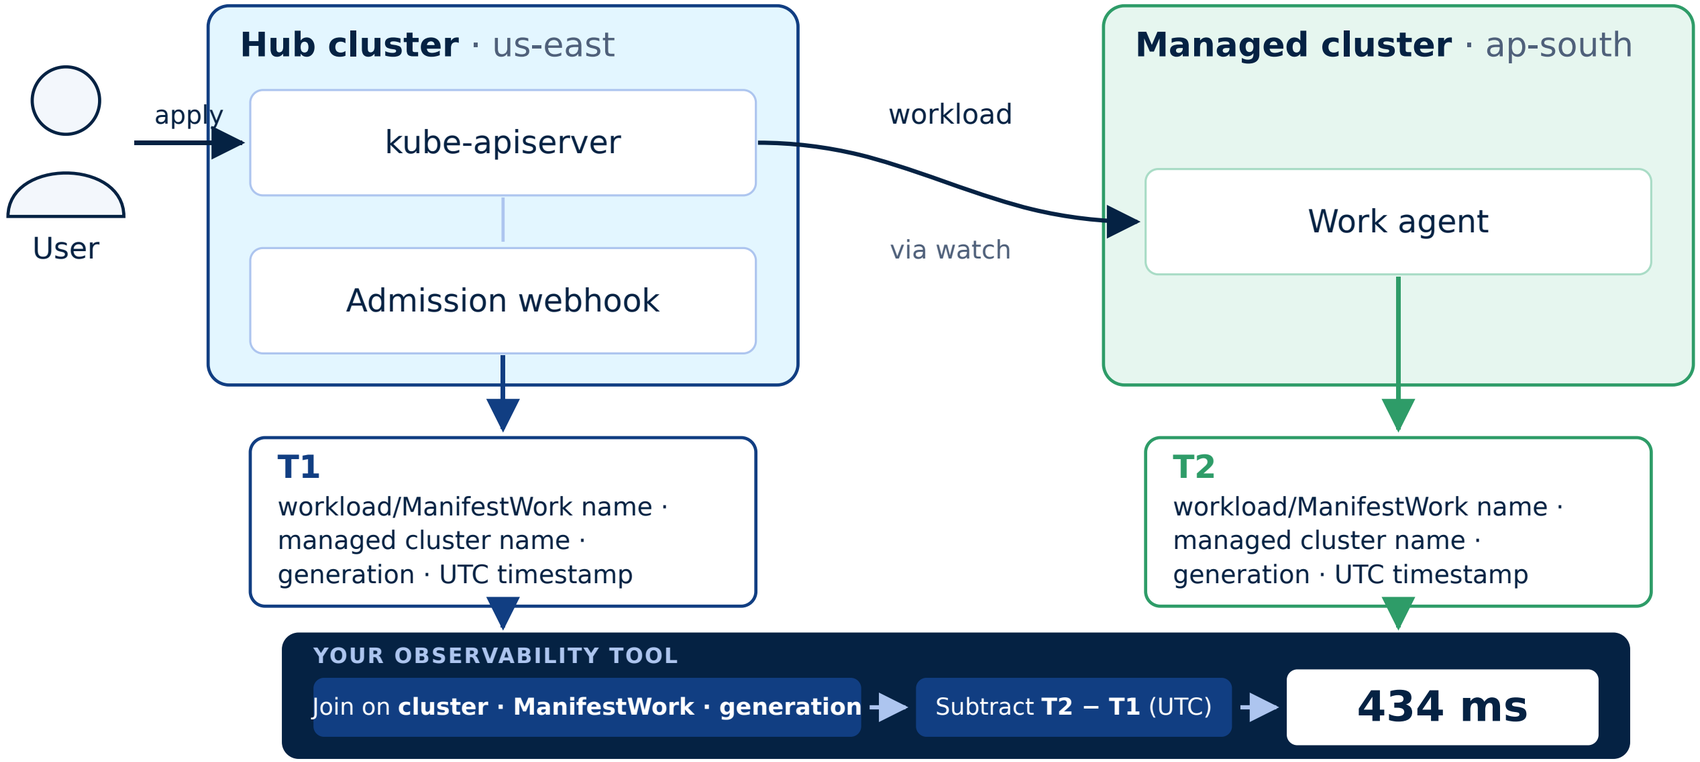

At Guidewire: one hub cluster, many regions

> The hub cluster knows the workload was **accepted**. It can't tell us **how long** it took to land in each region, or **whether it landed at all**.

Two timestamps, one key

T2 log: in **OCM v1.4**, contributed by Guidewire

5 Your observability tool joins the two logs on the key and subtracts the timestamps.

Match the two logs

T1 HUB CLUSTER ADMISSION WEBHOOK

```
workload/ManifestWork=workload-1
managed cluster=ap-south
generation=2
timestamp=08:05:00.200 UTC
```

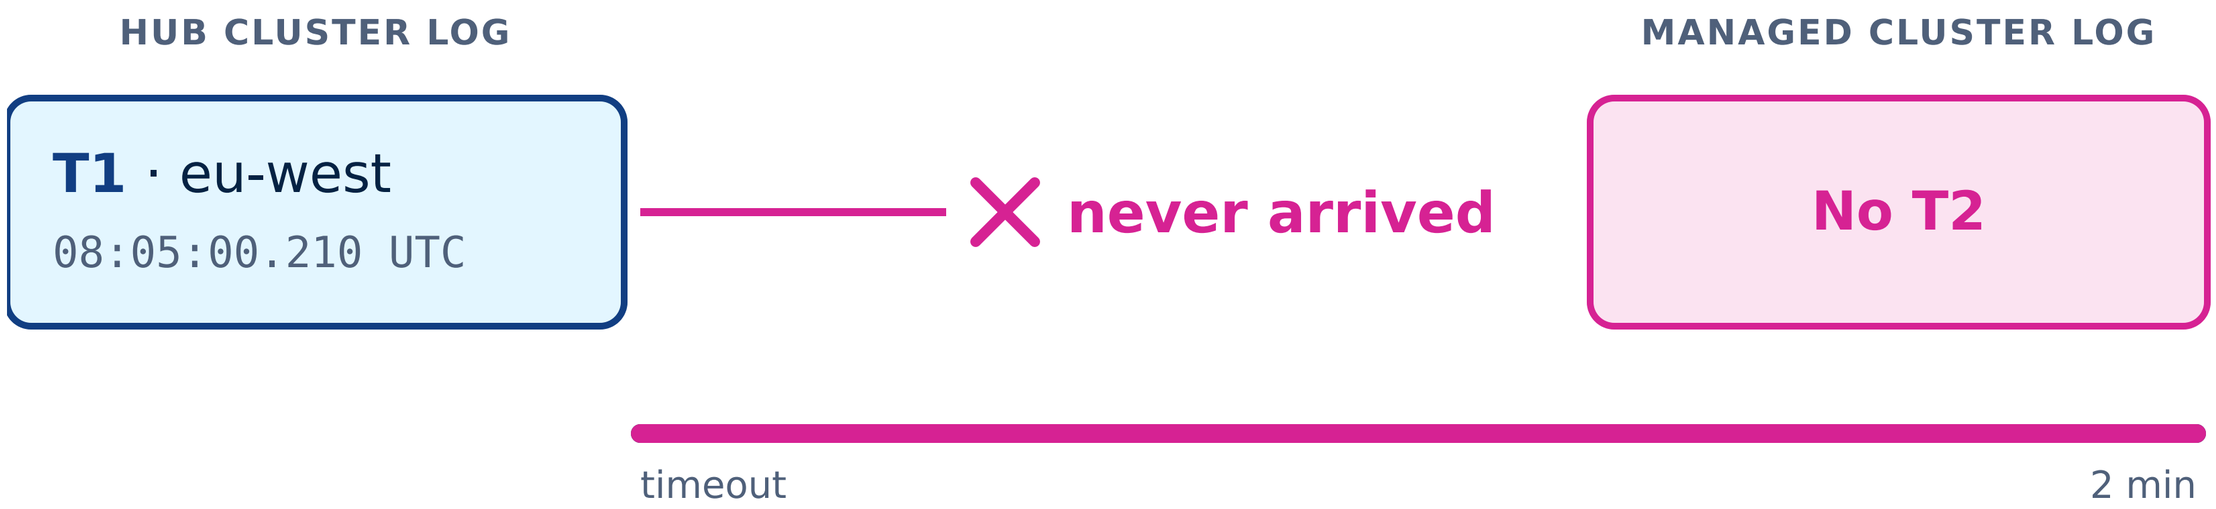

T2 MANAGED CLUSTER WORK AGENT

```
workload/ManifestWork=workload-1
managed cluster=ap-south
generation=2
timestamp=08:05:00.634 UTC
```

MANAGED CLUSTER	WORKLOAD/MANIFESTWORK	GENERATION	LATENCY
ap-south	workload-1	1	912 ms
ap-south	workload-1	2	**434 ms**
ap-south	workload-1	3	**NEVER ARRIVED**

Example output from the sample logs.

Never arrived? Look for the missing T2

> **T1** with no **T2** after a timeout: the workload **never arrived**.

Works with any observability tool

1. **Find** the hub cluster log (**T1**) and the managed cluster log (**T2**)
2. **Match** them on managed cluster name + workload/ManifestWork name + generation
3. **Subtract**: **T2** − **T1** = latency
4. **Catch** the missing **T2**: none after a timeout = **never arrived**

Thank you
